Foodpanda : A food ordering website

Description: A food ordering website developed with ASP.NET and Oracle database with location based search and separate menus to order from. It assigns available delivery person and vehicle and manages commission.

Platform: Oracle database

IDE: Microsoft ASP.NET

Role in Project: Management of user account signup and sign-in, food cart, restaurant pages, menu, order details, employee allocation.

Features:
- User can create account and login to order food.
- User can search for restaurants based on locations.
- User can see menus of each restaurant and select quantity of item
- User can order from various restaurants under a single order.
- User can remove item from cart.
- On confirming order employee will be allocated to user and a timer of 40mins will be shown. If food is delivered within this time, employee will get a commission.
